# Considerazioni metodologiche

## Efficacy trials vs. safety trials

	Efficacy trials	Safety trials
Aim	Demonstrate CV benefit	Demonstrate CV safety
Aim of treatment	Maximize HbA1c difference	Minimize HbA1c difference (equipoise)
Comparator	Usually active drug	Usually placebo
Study population	High proportion of patients without CVD/CKD	High proportion of patients with CVD/CKD
Primary endpoint	Heterogeneous	MACE
Study duration	Pre-specified	Event driven
Primary analysis	Superiority	Non inferiority

**Figure 1. Cardiovascular Outcomes.**

Shown are cumulative-incidence plots for the primary outcome (first major adverse cardiovascular events, representing a composite of death from cardiovascular causes, nonfatal myocardial infarction, or nonfatal stroke) (Panel A), nonfatal myocardial infarction (Panel B), nonfatal stroke (Panel C), and death from cardiovascular causes (Panel D). Cumulative-incidence estimates are based on time from randomization to first event confirmed by the event-adjudication committee, with death from noncardiovascular causes (Panels A and D) or death from any cause modeled as competing risks. Data for patients were censored at the end of the in-trial observation period (from randomization to the final follow-up visit). Deaths from cardiovascular causes included deaths for which the cause was undetermined. The analysis for confirmation of noninferiority was controlled for multiple comparisons; P values and confidence intervals for other analyses have not been adjusted for multiple comparisons. The insets show the same data on an expanded y axis. CI denotes confidence interval.

## Added value of this study

The REWIND trial of 9901 people had a long median follow-up period of 5.4 years, recruited a low proportion of people (31.5%) with previous cardiovascular disease, a high proportion of women (46.3%), and followed people with a mean HbA<sub>1c</sub> of 7.3%.

# In cosa si differenzia ?

# Treatment DM2 in primary prevention of CVD

## Recommendations for Adults With Type 2 Diabetes Mellitus

Referenced studies that support recommendations are summarized in [Online Data Supplement 10](#).

COR	LOE	Recommendations
I	A	1. For all adults with T2DM, a tailored nutrition plan focusing on a heart-healthy dietary pattern is recommended to improve glycemic control, achieve weight loss if needed, and improve other ASCVD risk factors (S4.2-1, S4.2-2).
I	A	2. Adults with T2DM should perform at least 150 minutes per week of moderate-intensity physical activity or 75 minutes of vigorous-intensity physical activity to improve glycemic control, achieve weight loss if needed, and improve other ASCVD risk factors (S4.2-3, S4.2-4).
Ila	B-R	3. For adults with T2DM, it is reasonable to initiate metformin as first-line therapy along with lifestyle therapies at the time of diagnosis to improve glycemic control and reduce ASCVD risk (S4.2-5–S4.2-8).
IIb	B-R	4. For adults with T2DM and additional ASCVD risk factors who require glucose-lowering therapy despite initial lifestyle modifications and metformin, it may be reasonable to initiate a sodium-glucose cotransporter 2 (SGLT-2) inhibitor or a glucagon-like peptide-1 receptor (GLP-1R) agonist to improve glycemic control and reduce CVD risk (S4.2-9–S4.2-14).

**Figure 2: Risk of MACE and each of its components**

Three-component MACE consisted of cardiovascular death, myocardial infarction, and stroke. NNTs are calculated over an estimated median follow-up of 3.2 years. MACE=major adverse cardiovascular events. GLP-1=glucagon-like peptide-1. NNT=number needed to treat. \*For PIONEER 6, data for fatal and non-fatal myocardial infarction and stroke were not available, so numbers and estimates refer to non-fatal myocardial infarction and non-fatal stroke exclusively.

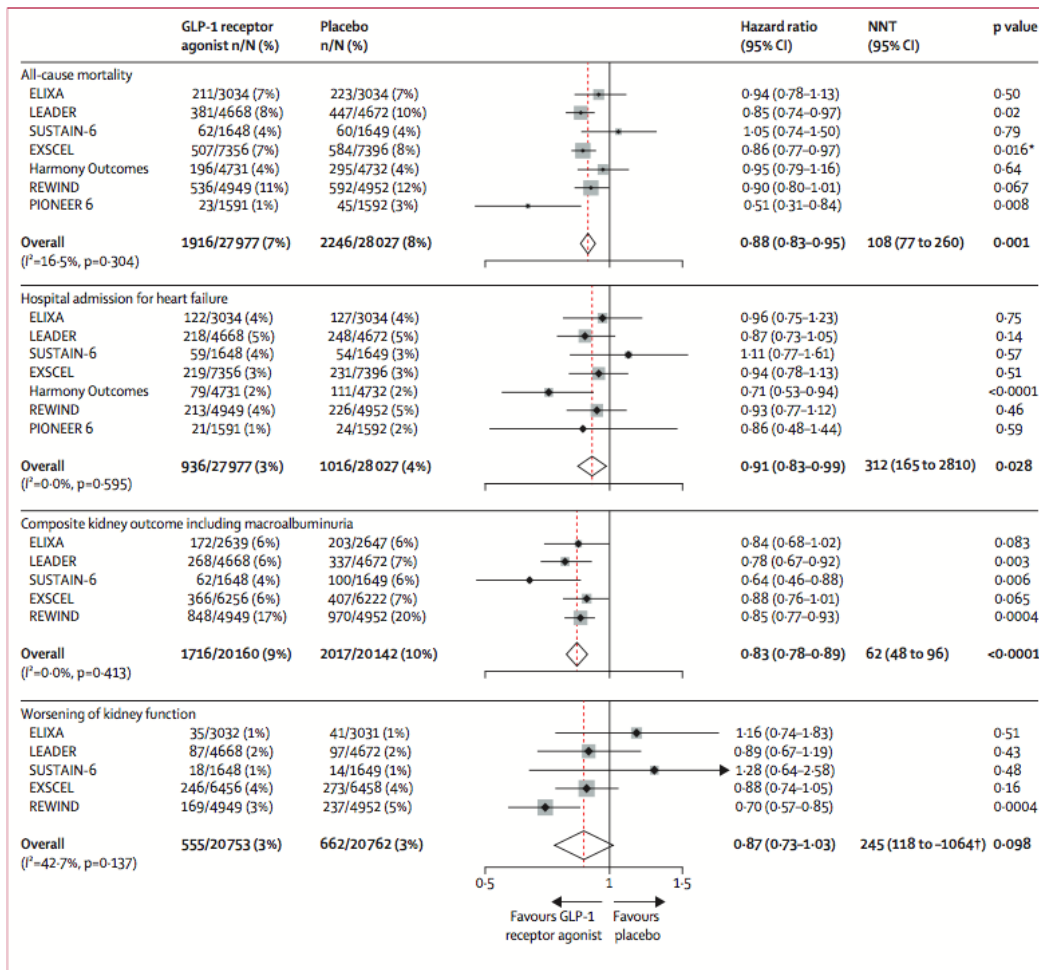

Figure 4: All-cause mortality, hospital admission for heart failure, and kidney outcomes

# Omologia con GLP1 umano ?

**Figure 3: Subgroup analyses for risk of three-component MACE**

Three-component MACE consisted of cardiovascular death, myocardial infarction, and stroke. Subgroup denominators are participants with available data.

MACE=major adverse cardiovascular events. GLP-1=glucagon-like peptide-1. eGFR=estimated glomerular filtration rate. \*High baseline HbA<sub>1c</sub> was defined as >7.5% in ELIXA, >8.3% in LEADER, >8.5% in SUSTAIN-6, >8.0% in EXSCAL, >8.0% in Harmony Outcomes, >7.2% in REWIND, and >8.5% in PIONEER 6. †In REWIND, the BMI categories used were ≤32 kg/m<sup>2</sup> and >32 kg/m<sup>2</sup>. ‡In REWIND, the age group categories used were <66 and ≥66 years; in LEADER, the age group categories used were <60 and ≥60 years.

## A. MALATTIA CARDIOVASCOLARE

### RACCOMANDAZIONE GENERALE

Un intervento intensivo e multifattoriale teso all'ottimizzazione di tutti i fattori di rischio cardiovascolare mediante modificazioni dello stile di vita e idonea terapia farmacologica deve essere implementato in tutti i pazienti con diabete tipo 2.
