*In recent years, we have witnessed an explosion of the information derived from genetics and biology that has paved the way for better understanding of physiology and pathology for a number of diseases.*

*The area of dyslipidemias is not an exception: with the advent of new technologies for studies of the genetic code, the knowledge of human genetics of lipoproteins has improved tremendously.*

*Translational medicine and understanding of the genetic cause of a condition is crucial for an adequate care. Furthermore, the study of human DNA and disease causing mutation has led to new drug discovery to treat dyslipidemia.*

*This meeting will address these new frontiers as well as how this new knowledge affects our clinical approach to the control of dyslipidemias and ultimately of cardiovascular disease.*

*Top scientists from the field will address these issues with a series of lectures that will benefit not only physicians, but also professionals in pharmacology, genetics or biology with an interest in this area.*

Prof. Alberico L. Catapano  
*President of the Meeting*
